EVENT FRAMES

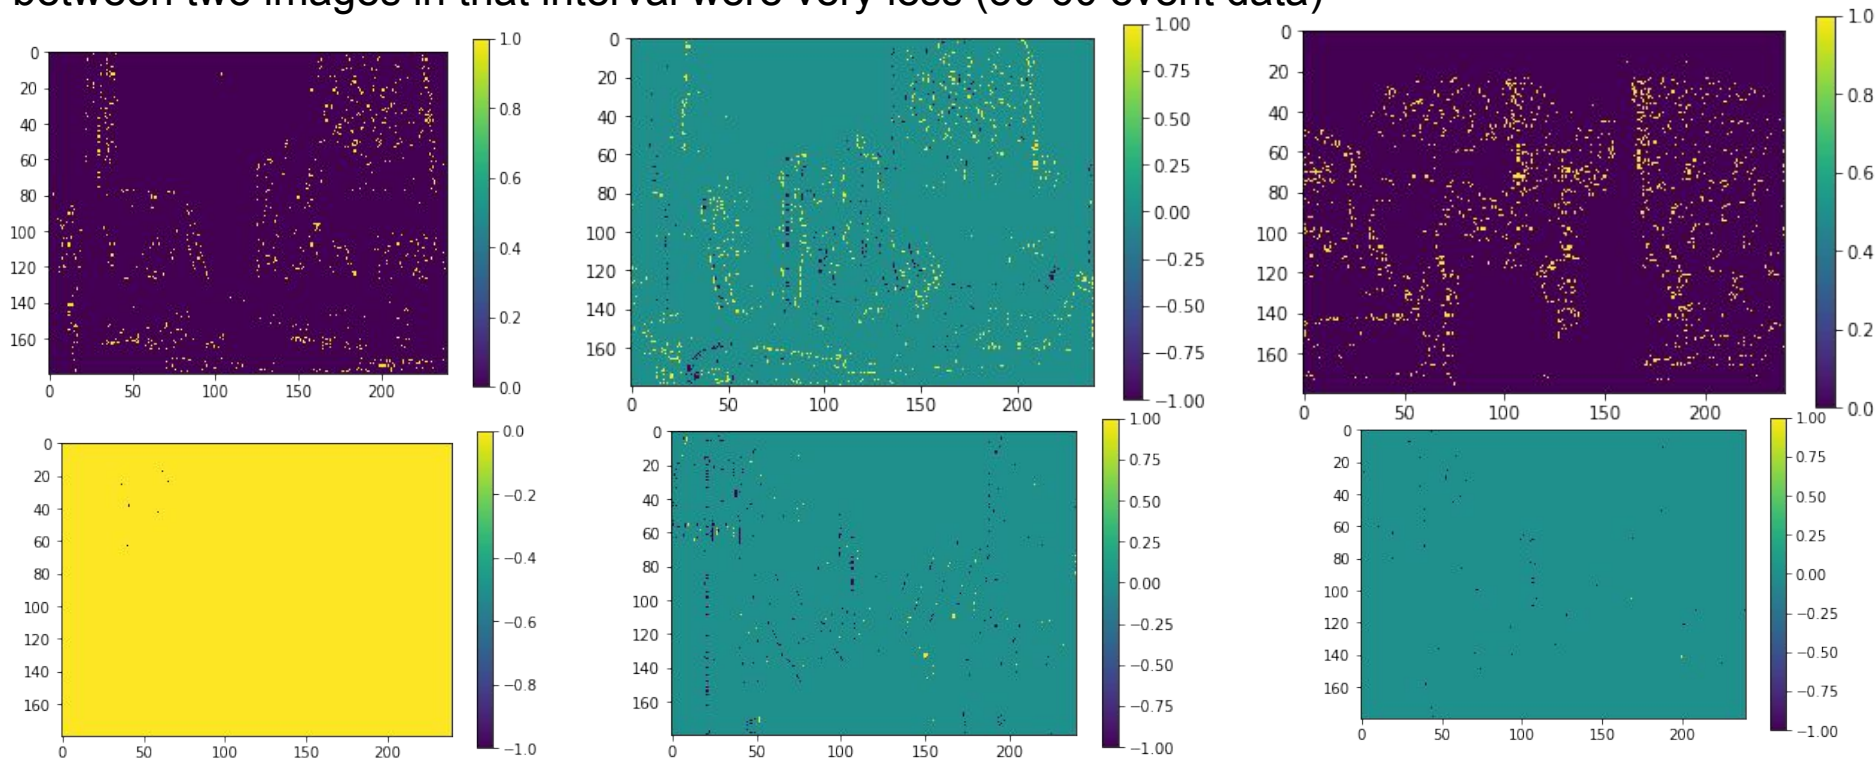

Generated by dividing the event data between every two given image timestamps into 10 uniform intervals. Thus we get $86 \times 10 = 860$ event frames

(Sequence from Left to Right) : 0 , 81 , 330 , 458 , 635 , 766

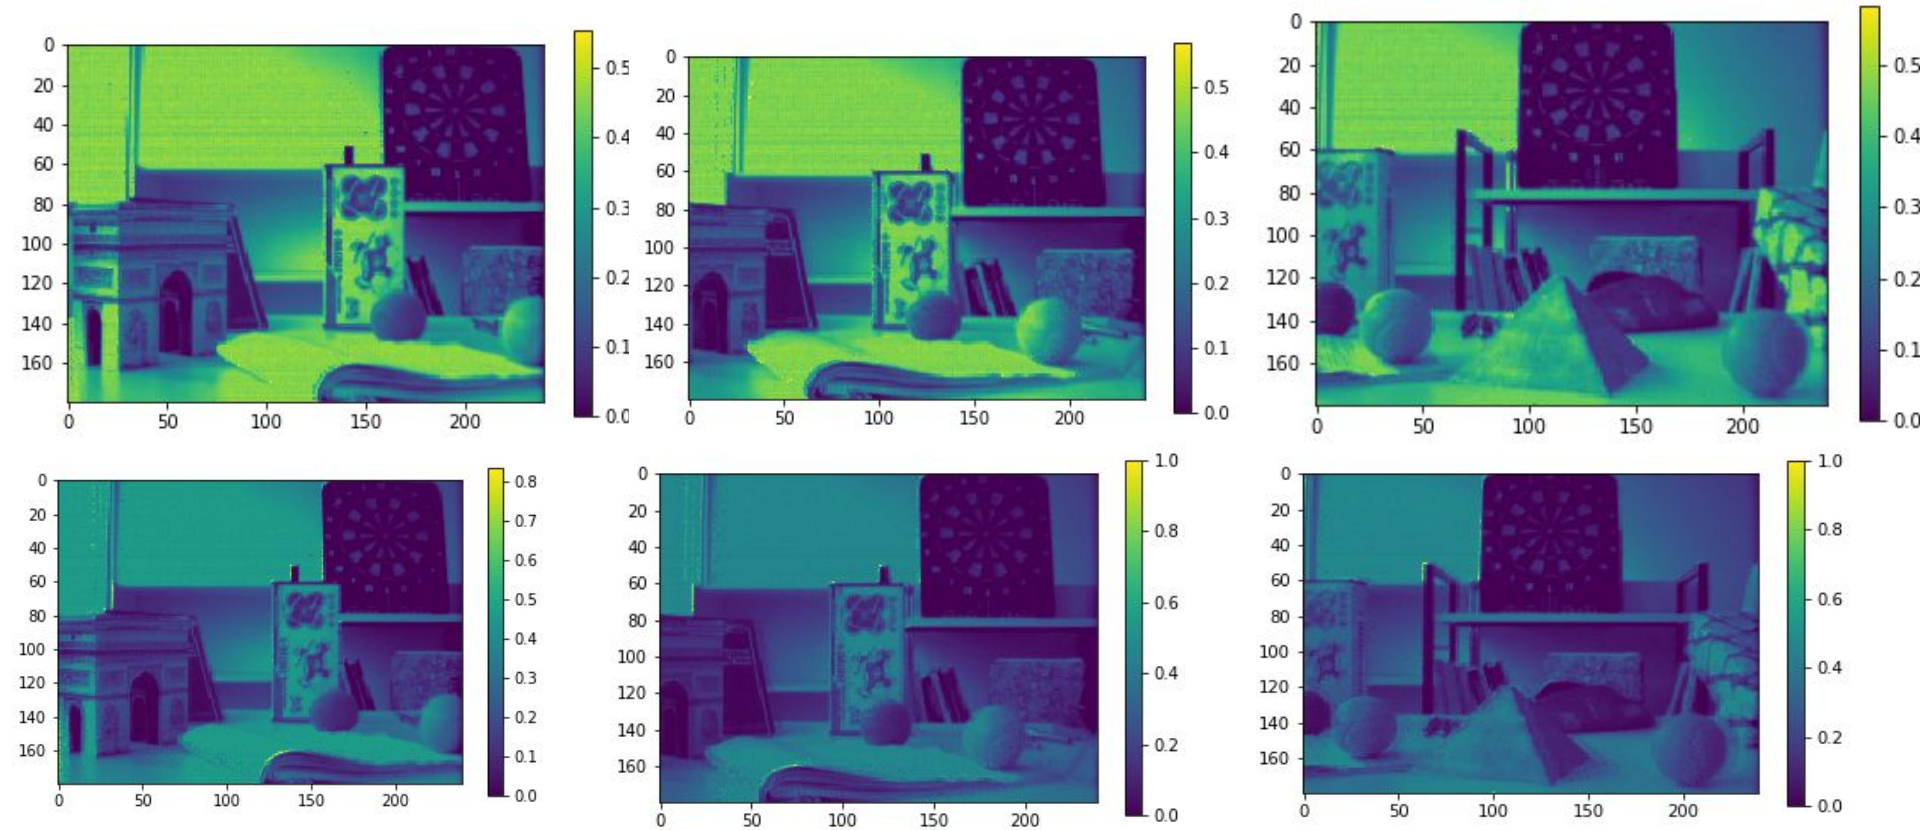

SLIDER_DEPTH DATASET

The event frames were not clear that are corresponding to the last uniform interval of event data between two images, after which the event data following the new image starts. Also there were much sparsity in the later images because the number of events recorded between two images in that interval were very less (50-60 event data)

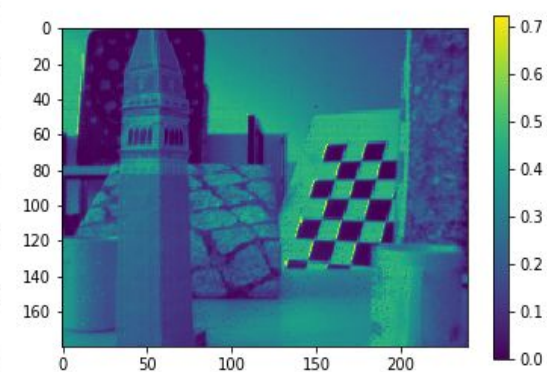

(Sequence from Left to Right) : 9 , 119 , 659 , 852 , 825 , 831

Intermediate Image Frames Generated Using Forward & Backward Formula

UP: Data **Down: Label**

0 , 81 , 330

UP: Data ; Down: Label

458 ; 635 ; 766

9 ; 659 ; 852

TRAINING WITH A U-NET ARCHITECTURE

- U-Net Architecture was used to train a model where data is the images generated using forward formula, $I_n = I_0 \exp\{\gamma(E_1 + E_2 + \dots + E_n)\}$ and labels were generated using backward formula $I_n = I_m \exp\{-\gamma(E_{n+1} + \dots + E_m)\}$. ($m > n$); $\gamma = 0.2$
